

EMPLOYEE LEAVE MANAGEMENT SYSTEM

Certificate

This is to certify that the mini project entitled 'Employee Leave Management System' is a bonafide work carried out by the student under the guidance of the project supervisor.

[illegible]

Declaration

I hereby declare that this project report entitled 'Employee Leave Management System' is my original work and has not been submitted elsewhere for any degree or diploma.

[illegible]

Acknowledgement

I express my sincere gratitude to my guide, department faculty members, friends, and family for their support and encouragement during the development of this project.

[illegible]

Abstract

The Employee Leave Management System is a web-based application developed using Java, JSP, Servlets, and MySQL. The system automates leave application, approval, and tracking processes.

[illegible]

Introduction

Organizations often manage employee leave records manually, leading to paperwork, delays, and errors. This project provides a computerized leave management solution that improves efficiency and accuracy.

[illegible]

Objectives

- Automate leave management.
- Reduce paperwork.
- Maintain leave records.
- Provide online approval and status tracking.
- Improve organizational efficiency.

[illegible]

Scope of the Project

The project can be used in educational institutions, companies, hospitals, and government offices where employee leave requests need to be managed efficiently.

[illegible]

Problem Statement

Manual leave management systems consume time and are difficult to maintain. A computerized system is needed to manage leave requests and approvals effectively.

[illegible]

Existing System

The existing system is manual and paper-based. It is difficult to track leave records and generate reports.

[illegible]

Proposed System

The proposed system is a web-based application where employees apply for leave online and administrators approve or reject requests.

[illegible]

Software Requirements

Operating System: Windows 10/11 Programming Language: Java Frontend: HTML, CSS, JSP
Backend: Servlets Database: MySQL Web Server: Apache Tomcat IDE: VS Code

[illegible]

Hardware Requirements

Processor: Intel i3 or above RAM: 4 GB or above Storage: 2 GB free space.

[illegible]

System Architecture

The system follows a three-tier architecture consisting of presentation layer, business layer, and database layer.

[illegible]

Modules Description

1. Login Module 2. Employee Module 3. Leave Application Module 4. Leave Status Module 5. Admin Approval Module 6. Database Connectivity Module

[illegible]

Database Design

Table 1: users(id, username, password, role) Table 2: leaves(leave_id, username, leave_date, reason, status).

[illegible]

Input Design

Input forms are provided for login and leave application with proper validations.

[illegible]

Output Design

The system displays dashboards, leave status reports, and approval pages.

[illegible]

Implementation

The application is implemented using Java Servlets, JSP pages, and MySQL database connectivity through JDBC.

[illegible]

Testing

Unit testing and integration testing were performed to verify login, leave application, and approval functionalities.

[illegible]

Advantages

Easy to use, secure, paperless, faster processing, and centralized record management.

[illegible]

Applications

Applicable in companies, schools, colleges, hospitals, and offices.

[illegible]

Future Enhancements

Email notifications, leave balance calculation, password encryption, mobile app integration, and reporting features.

[illegible]

Conclusion

The Employee Leave Management System successfully automates employee leave processing and provides an efficient and reliable solution.

[illegible]
